What is Typescript?

Typescript is a programming language that extends JavaScript with static typing. This means that Typescript code is type-checked at compile time, which helps to identify and prevent errors before they occur at runtime.

Typescript offers a number of benefits over JavaScript, including:

- Improved code quality: Typescript's static typing helps to catch errors early on, reducing the number of bugs in your code.
- Increased developer productivity: Typescript's autocompletion and refactoring features can help you to write code more quickly and efficiently.
- Better code documentation: Typescript's type annotations provide documentation for your code, making it easier for others to understand and maintain.

What's Inside the Typescript Guide?

John Au Yeung's "Typescript Guide" is a comprehensive resource that covers all aspects of Typescript, including:

- Getting started with Typescript
