For over a century, the cause of the Titanic disaster has been the subject of much debate. Some historians believe that the ship was sunk by a single iceberg, while others believe that a combination of factors, such as a fire in the ship's coal bunker, a design flaw in the ship's hull, and a lack of proper safety regulations, contributed to the sinking.

In his new book, *What Really Sank The Titanic: New Forensic Discoveries*, author Senan Molony argues that the Titanic was not sunk by an iceberg,

but by a combination of factors. Molony's theory is based on new forensic evidence that he has uncovered, including:

- A previously unknown hole in the Titanic's hull, which was caused by a fire in the ship's coal bunker.
- A design flaw in the Titanic's hull, which made the ship more likely to break apart when it hit the iceberg.
- A lack of proper safety regulations, which allowed the Titanic to sail without enough lifeboats.

Molony's book is a groundbreaking work that challenges the traditional narrative of the Titanic disaster. His new evidence provides a compelling case that the Titanic was not sunk by an iceberg, but by a combination of factors. This new understanding of the Titanic disaster is sure to spark a new debate about one of the most famous maritime disasters in history.
